Abstract (This will be our abstract.)

Our project aims to develop a machine learning model in Julia to predict the likelihood of floods based on the monthly and annual rainfall in Kerala, a flood-prone subdivision in India. Leveraging a publicly available dataset, we will analyze historical rainfall patterns and develop a robust regression model to estimate flood probabilities. This model has the potential to be a valuable tool for for policymakers, disaster management authorities, and local communities, providing timely insights to improve flood preparedness and mitigation strategies. The motivation behind this project lies in the increasing frequency and severity of floods, exacerbated by climate change and rapid urbanization. Kerala, in particular, has experienced devastating floods in recent years, making accurate flood prediction models critical for risk management. Our machine learning approach will incorporate rainfall data and the use of advanced regression techniques, allowing for a flexible and reliable flood forecasting tool. Employing machine learning techniques, we aim to develop a model that can adapt to changing weather patterns, offering a flexible and reliable flood forecasting tool. Ultimately, our work seeks to contribute to the broader efforts of minimizing the human, infrastructural and environmental losses caused by floods. Ultimately, our aim is to contribute to the development of more effective flood prediction and management systems.

This manuscript is a template (aka "rootstock") for <u>Manubot</u>, a tool for writing scholarly manuscripts. Use this template as a starting point for your manuscript.

The rest of this document is a full list of formatting elements/features supported by Manubot. Compare the input (.md files in the /content directory) to the output you see below.

Dataset Description

- Source: This dataset can be found on Kaggle, at this link:
 https://www.kaggle.com/code/mukulthakur177/flood-prediction-model. It was generated to help build a predictive model for flood occurrences using meteorological and environmental factors.
- Format: The dataset is in CSV format, which is commonly used for tabular data storage. Each row represents a specific data point, with columns detailing various features that might impact flood conditions.
- Contents: The columns of the dataset cover parameters typically used to forecast flood situations, and the dataset serves as a basis for training machine learning models in flood prediction. More specifically, the dataset includes the following columns:
 - 1. Rainfall (mm): Represents the amount of rainfall in millimeters. This is a key factor in flood prediction models.
 - 2. Temperature (°C): Indicates the temperature in degrees Celsius.
 - 3. Humidity (%): Provides the humidity level in percentage, which can influence weather conditions and potential flood situations.
 - 4. Flood (0/1): A binary indicator where '0' signifies no flood, and '1' indicates a flood event.

Proposal

Our team plans to use the Kaggle flood prediction dataset to develop a machine learning model in Julia that predicts the likelihood of floods in Kerala, India. We will analyze the historical monthly rainfall, temperature, and humidity data in the dataset to identify patterns correlated with flood occurrences. By applying regression techniques, we aim to create a model that estimates flood probabilities accurately, providing a valuable tool for disaster management authorities and local communities.

The motivation behind this project stems from the increasing frequency of floods due to climate change, particularly in Kerala. Accurate prediction models are crucial for improving flood preparedness and risk mitigation strategies. Our model will offer timely insights, ultimately contributing to reducing the human, infrastructural, and environmental losses caused by floods in this region.
